Door Post Root Rib Covers

These parts have been marked with approximate trim lines, but it is strongly suggested that you trim these parts a little at a time to fit make them fit your individual cage. Cage position varies from hull to hull. Remove the internal door handle to make it easier to do the fitting. After the covers have been fitted to your satisfaction mark and cut slots for the door handle. The covers can be installed after final fit with the door handle in position. This may seem impossible but the covers can be slipped over the handle from the aft side moving forward. Although the covers are constructed from Hydrex vinyl ester resin and are quite strong for their weight they can fracture especially at the bend where the cover transitions from the wing root down to the cable covers. The instrument panel should be installed prior to fitting the covers.

The covers should be attached to the fuselage tube with 1" Velcro. The lower pulley covers should be installed after the main cable covers have been installed.

If you find it necessary to repair or add glass onto these covers you can do that by using epoxy or the vinyl ester resin supplied by S/H.

Handle with care
